19 August 2015 Effects of partial ileal bypass on plasma low density lipoprotein and postheparin plasma lipoprotein lipase in rats. The effects of partial ileal bypass on plasma low density lipoprotein (LDL) and postheparin plasma lipoprotein lipase (LPL) were studied in rats. Compared to sham-operated animals, plasma LDL cholesterol and low density lipoprotein protein fraction (LDL-P) were reduced to approximately 10% of the control values by 6 weeks after ileal bypass. Plasma lipoprotein triglycerides were also lower than in sham-operated rats but only at the 6 week time point. The difference in plasma triglyceride levels between the two groups was due largely to differences in remnant triglyceride. By contrast, plasma LPL was not different from control values at any time after ileal bypass. Postheparin plasma LPL activity was 4-5% of the control activity at 6 weeks and 1.5% of the control activity at 12 weeks after bypass, despite marked differences in plasma triglycerides (7-11-fold higher than control). The present results indicate that partial ileal bypass in the rat results in lowered plasma LDL and remnant lipoprotein cholesterol.

Q: What does  $\Omega$  mean on the old Klyne barcode? I have scanned thousands of Klyne barcodes and I have not seen a barcode with this notation, but I am still confused since the  $\Sigma$  and the  $\sigma$  are usually in direct motion with the  $\Omega$  (velocity) barcode, making the  $d'$  anachronism (which is a cross?) and the  $\Omega$  an anachronism too. Even with the sideways motion, I've never seen a barcode with this notation. What does this mean?

A: This symbol comes from the A-space and Q-space versions of the Klyne barcode set. Instead of putting it in the  $d'$  and the  $\Omega$  positions, it is placed in the A and Q positions. When I have a copy of one of the original A and Q Klyne sets, I am able to encode the data as well. I can think of two reasons why they placed this in the A and Q spaces. One is to give backward compatibility so that whoever made this version of the Klyne barcode set would be able to encode the data correctly. The other is to f678ea9f9e
